

8.5 Time Class Case Study: Overloaded Constructors

As you know, you can declare your own constructor to specify how objects of a class should be initialized. Next, we demonstrate a class with several **overloaded constructors** that enable objects of that class to be initialized in different ways. To overload constructors, simply provide multiple constructor declarations with different signatures.

Class Time2 with Overloaded Constructors

The `Time1` class's default constructor in [Fig. 8.1](#) initialized `hour`, `minute` and `second` to their default 0 values (i.e., midnight in universal time). The default constructor does not enable the class's clients to initialize the time with nonzero values. Class `Time2` ([Fig. 8.5](#)) contains five overloaded constructors that provide convenient ways to initialize objects. In this program, four of the constructors invoke a fifth, which in turn ensures that the value supplied for `hour` is in the range 0 to 23, and the values for `minute` and `second` are each in the range 0 to 59. The compiler invokes the appropriate constructor by matching the number, types and order of the

types of the arguments specified in the constructor call with the number, types and order of the types of the parameters specified in each constructor declaration. Class `Time2` also provides *set* and *get* methods for each instance variable.

```
1 // Fig. 8.5: Time2.java
2 // Time2 class declaration with overloaded constructors
3
4 public class Time2 {
5     private int hour; // 0 - 23
6     private int minute; // 0 - 59
7     private int second; // 0 - 59
8
9     // Time2 no-argument constructor:
10    // initializes each instance variable to zero
11    public Time2() {
12        this(0, 0, 0); // invoke constructor with
13    }
14
15    // Time2 constructor: hour supplied, minute and second are zero
16    public Time2(int hour) {
17        this(hour, 0, 0); // invoke constructor with
18    }
19
20    // Time2 constructor: hour and minute supplied, second is zero
21    public Time2(int hour, int minute) {
22        this(hour, minute, 0); // invoke constructor with
23    }
24
25    // Time2 constructor: hour, minute and second supplied
26    public Time2(int hour, int minute, int second) {
27        if (hour < 0 || hour >= 24) {
28            throw new IllegalArgumentException("hour must be 0-23");
29        }
30
31        if (minute < 0 || minute >= 60) {
32            throw new IllegalArgumentException("minute must be 0-59");
33        }
34    }
35}
```

```

34
35         if (second < 0 || second >= 60) {
36             throw new IllegalArgumentException("sec
37                 }
38
39         this.hour = hour;
40         this.minute = minute;
41         this.second = second;
42     }
43
44     // Time2 constructor: another Time2 object su
45     public Time2(Time2 time) {
46         // invoke constructor with three arguments
47         this(time.hour, time.minute, time.second);
48     }
49
50     // Set Methods
51     // set a new time value using universal time;
52     // validate the data
53     public void setTime(int hour, int minute, int
54         if (hour < 0 || hour >= 24) {
55         throw new IllegalArgumentException("hou
56             }
57
58         if (minute < 0 || minute >= 60) {
59         throw new IllegalArgumentException("min
60             }
61
62         if (second < 0 || second >= 60) {
63         throw new IllegalArgumentException("sec
64             }
65
66         this.hour = hour;
67         this.minute = minute;
68         this.second = second;
69     }
70
71     // validate and set hour
72     public void setHour(int hour) {
73         if (hour < 0 || hour >= 24) {

```

```

74         throw new IllegalArgumentException("hou
75             }
76
77         this.hour = hour;
78     }
79
80     // validate and set minute
81     public void setMinute(int minute) {
82         if (minute < 0 || minute >= 60) {
83             throw new IllegalArgumentException("min
84                 }
85
86         this.minute = minute;
87     }
88
89     // validate and set second
90     public void setSecond(int second) {
91         if (second < 0 || second >= 60) {
92             throw new IllegalArgumentException("sec
93                 }
94
95         this.second = second;
96     }
97
98     // Get Methods
99     // get hour value
100    public int getHour() {return hour;}
101
102    // get minute value
103    public int getMinute() {return minute;}
104
105    // get second value
106    public int getSecond() {return second;}
107
108    // convert to String in universal-time forma
109    public String toUniversalString() {
110        return String.format(
111            "%02d:%02d:%02d", getHour(), getMinute
112        }
113

```

```
114      // convert to String in standard-time format
115      public String toString() {
116          return String.format("%d:%02d:%02d %s",
117              ((getHour() == 0 || getHour() == 12) ?
118                  getMinute(), getSecond(), (getHour() <
119                      }
120                  }
```

Fig. 8.5

Time2 class declaration with overloaded constructors.

Class Time2's Constructors —Calling One Constructor from Another via `this`

Lines 11–13 declare a so-called **no-argument constructor** that's invoked without arguments. Once you declare any constructors in a class, the compiler will *not* provide a *default constructor*. This no-argument constructor ensures that class Time2's clients can create Time2 objects with default values. Such a constructor simply initializes the object as specified in the constructor's body. In the body, we introduce a use of `this` that's allowed only as the *first* statement in a constructor's body. Line 12 uses `this` in method-call syntax to invoke the Time2 constructor that takes three parameters (lines 26–42) with values of 0 for the hour, minute and

second. Using `this` as shown here is a popular way to *reuse* initialization code provided by another of the class's constructors rather than defining similar code in the no-argument constructor's body. A constructor that calls another constructor in this manner is known as a **delegating constructor**. We use this syntax in four of the five `Time2` constructors to make the class easier to maintain and modify. If we need to change how objects of class `Time2` are initialized, only the constructor that the class's other constructors call will need to be modified.

Common Programming Error 8.2

It's a compilation error when `this` is used in a constructor's body to call another of the class's constructors if that call is not the first statement in the constructor. It's also a compilation error when a method attempts to invoke a constructor directly via `this`.

Lines 16–18 declare a `Time2` constructor with a single `int` parameter representing the `hour`, which is passed with 0 for the `minute` and `second` to the constructor at lines 26–42. Lines 21–23 declare a `Time2` constructor that receives two `int` parameters representing the `hour` and `minute`, which are passed with 0 for the `second` to the constructor at lines 26–42. Like the no-argument constructor, each of these constructors invokes the three-argument constructor to

minimize code duplication. Lines 26–42 declare the `Time2` constructor that receives three `int` parameters representing the `hour`, `minute` and `second`. This constructor validates and initializes the instance variables.

Lines 45–48 declare a `Time2` constructor that receives a reference to another `Time2` object. The argument object's values are passed to the three-argument constructor to initialize the `hour`, `minute` and `second`. Line 47 directly accesses the `hour`, `minute` and `second` values of the argument `time` with the expressions `time.hour`, `time.minute` and `time.second`—even though `hour`, `minute` and `second` are declared as `private` variables of class `Time2`. This is due to a special relationship between objects of the same class.

Software Engineering Observation 8.5

When one object of a class has a reference to another object of the same class, the first object can access all the second object's data and methods (including those that are private).

Class `Time2`'s `setTime`

Method

Method `setTime` (lines 53–69) throws an `IllegalArgumentException` (lines 55, 59 and 63) if any of the method’s arguments is out of range. Otherwise, it sets `Time2`’s instance variables to the argument values (lines 66–68).

Notes Regarding Class `Time2`’s Set and Get Methods and Constructors

`Time2`’s *get* methods are called from other methods of the class. In particular, methods `toUniversalString` and `toString` call `getHour`, `getMinute` and `getSecond` in line 111 and lines 117–118, respectively. In each case, these methods could have accessed the class’s private data directly without calling the *get* methods. However, consider changing the representation of the time from three `int` values (requiring 12 bytes of memory) to a single `int` value representing the total number of seconds that have elapsed since midnight (requiring only four bytes of memory). If we made such a change, only the bodies of the methods that access the `private` data directly would need to change—in particular, the three-argument constructor, the `setTime` method and the individual *set* and *get* methods for the `hour`, `minute` and `second`. There would be no need to modify the

bodies of methods `toUniversalString` or `toString` because they do *not* access the data directly. Designing the class in this manner reduces the likelihood of programming errors when altering the class's implementation.

Similarly, each `Time2` constructor could include a copy of the appropriate statements from the three-argument constructor. Doing so may be slightly more efficient, because the extra constructor calls are eliminated. But, *duplicating* statements makes changing the class's internal data representation more difficult. Having the `Time2` constructors call the constructor with three arguments requires that any changes to the implementation of the three-argument constructor be made only once. Also, the compiler can optimize programs by removing calls to simple methods and replacing them with the expanded code of their declarations—a technique known as **inlining the code**, which improves program performance.

Using Class `Time2`'s Overloaded Constructors

Class `Time2Test` (Fig. 8.6) invokes the overloaded `Time2` constructors (lines 6–10 and 21). Line 6 invokes the `Time2` no-argument constructor. Lines 7–10 demonstrate passing arguments to the other `Time2` constructors. Line 7 invokes the single-argument constructor that receives an `int` at lines 16–18 of Fig. 8.5. Line 8 of Fig. 8.6 invokes the two-argument constructor at lines 21–23 of Fig. 8.5. Line 9 of Fig. 8.6

invokes the three-argument constructor at lines 26–42 of [Fig. 8.5](#). Line 10 of [Fig. 8.6](#) invokes the single-argument constructor that takes a `Time2` at lines 45–48 of [Fig. 8.5](#). Next, the app displays the `String` representations of each `Time2` object to confirm that it was initialized properly (lines 13–17 of [Fig. 8.6](#)). Line 21 attempts to initialize `t6` by creating a new `Time2` object and passing three *invalid* values to the constructor. When the constructor attempts to use the invalid hour value to initialize the object’s `hour`, an `IllegalArgumentException` occurs. We catch this exception at line 23 and display its error message, which results in the last line of the output.

```
1 // Fig. 8.6: Time2Test.java
2 // Overloaded constructors used to initialize Time2 objects
3
4 public class Time2Test {
5     public static void main(String[] args) {
6         Time2 t1 = new Time2(); // 00:00:00
7         Time2 t2 = new Time2(2); // 02:00:00
8         Time2 t3 = new Time2(21, 34); // 21:34:00
9         Time2 t4 = new Time2(12, 25, 42); // 12:25:42
10        Time2 t5 = new Time2(t4); // 12:25:42
11
12        System.out.println("Constructed with:");
13        displayTime("t1: all default arguments", t1);
14        displayTime("t2: hour specified; default m", t2);
15        displayTime("t3: hour and minute specified", t3);
16        displayTime("t4: hour, minute and second s", t4);
17        displayTime("t5: Time2 object t4 specified", t5);
18
19        // attempt to initialize t6 with invalid values
20        try {
21            Time2 t6 = new Time2(27, 74, 99); // invalid values
22        }
```

```

23         catch (IllegalArgumentException e) {
24             System.out.printf("%nException while in
25                 e.getMessage());
26                 }
27             }
28
29     // displays a Time2 object in 24-hour and 12-
30     private static void displayTime(String header
31         System.out.printf("%s%n %s%n %s%n",
32         header, t.toUniversalString(), t.toStri
33         }
34     }

```

```

        Constructed with:
        t1: all default arguments
